The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oilgo-dT primer and an oilgouncleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
coligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oilgonucleotide comprises a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oilgonucleotide comprises a 3'-end sequence complementary to a
polynucleotide which comprises a 3'-end sequence complementary to a
polynucleotide comprises a 1-east 15 nucleotides and the complementary
the 5'-end sequence/3'-end sequence is selected from those defined in
the 5'-end sequence/3'-end sequence is selected from those defined in
the 5'-end sequence/3'-end sequence is selected from those defined in
the specification. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
the full-length without any specialised methods. AAH03166 to AAH13628 and
AAH13633 to AAH1872 tepresent human cDNA sequences?

AAH13633 to AAH1872 tepresent human cDNA sequences?
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of the present invention.

AAL19043 RESULT

```
The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is affilicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                            New peptide useful as a marker for the diagnosis of breast cancer
                                                                                                                                                                                                                                  (MILL-) MILLENNIUM PREDICTIVE MEDICINE INC

(AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynocleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynocleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              638
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cctgcatcgaaattctagcagctgaaccatccaccatatgtgcaggagagtcatttcaag 818

The present sequence encodes a human TANGO 261, TANGO 262, and TANGO 267. The TANGO 262, and TANGO 267. The TANGO Polypeptides can be used to modulate cellular proliferation, modulate cellular differentiation and/or modulate cellular adhesion. The proteins can be used to treat any von Willebrand catotr-associated disorder, regulate extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions, modulate cell adhesion in proliferative disorders, such as cancer, modulate the proliferation, differentiation, and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematopoietic associated diseases and disorders, atelectasis, pulmonary congestion or oedema, emphysema,
Novel human and murine secreted proteins designated TANGO 216, 261, 262, 266 and 267 useful as modulating agents of cellular processes,

AAA75157-59 encode human TANGO 216 proteins. The specification also describes TANGO 266, TANGO 261, TANGO 262, and TANGO 267. The TANGO consists of the cellular proliferation, modulate polypeptides can be used to modulate cellular adhesion. The cellular adhesion and/or modulate cellular adhesion. The discorder, regulate extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions, modulate cell adhesion in proliferation, modulate cellular interactions, modulate the proliferation, differentiation and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematropoietic associated diseases and disorders, atelectasis, confestion or oedema, emphysema, chronic bronchitis, bronchitis, bronchiectasis, intestinal disorders, spleen associated diseases, modulate renal disorders, treat cardiovascular disorders such as isohemic heart disease, modulate the proliferation, differentiation, and/or function of bone and cartilage cells and to treat bone and/or cartilage associated diseases or disorder. They may also be used to cartilage associated diseases or disorder. They may also be used to cartilage associated with the owaries, and cerebral oedema, hydrocephalus, brain herniations, latrogenic disease, inflammations, bacterial and viral meningitis, alzheimer's Disease, inflammations, thydrocephalus and encephalitis, and treat hepatic disorders.

modulate cell adhesion in proliferative disorders, such as cancer, modulate the proliferation, differentiation, and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematopoietic associated diseases and disorders, atelectasis, pulmonary congestion or oedema, emphysema, chronic bronchitis, bronchial asthma and bronchiectasis, intestinal disorders, spleen associated diseases, modulate renal disorders, treat cardiovascular disorders such as ischemic heart disease, modulate the proliferation, differentiation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and/or function of bone and cartilage cells and to treat bone and/or cartilage associated diseases or disorder. They may also be used to treat disorders associated with the ovaries, and cerebral oedema, hydrocephalus, brain hernitations, latrogenic disease, inflammations, bacterial and viral meningitis, Alzheimer's Disease, cerebral toxoplasmosis, Parkinson's disease, multiple sclerosis, brain cancers, hydrocephalus and encephalitis, and treat hepatic disorders.
                                                                                                                                                                                                                                                                                                                                                                               AAA75157-59 encode human TANGO 216 proteins. The specification also describes TANGO 266, TANGO 261, TANGO 262, and TANGO 267. The TANGO polypeptides can be used to modulate cellular proliferation, modulate cellular differantiation and/or modulate cellular adhesion. The proteins can be used to tream you Willebrand factor-associated disorder, regulate extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gtgggaaggagcggacctgctctccccgggctgcgggccatggccacggcggagcgag 123

cartibes TANGO 266, TANGO 262, and TANGO 267. The TANGO 267 cartibes TANGO 266, TANGO 267, and TANGO 267. The TANGO 267 callular differential unique in and/or modulate cellular adhesion. The cellular differentiation and/or modulate cellular adhesion. The proteins can be used to treat any von Willebrand factor-associated disorder, regulate extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions, modulate cellular interactions, and cell trafficking and/or migration, and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematopoietic associated diseases and disorders, atelectasis, confidential and hematopoietic associated diseases and disorders, spleen associated diseases and disorders, spleen associated diseases, modulate the proliferation, differentiation, as ischamic heart disorders, intestinal disorders, spleen associated cliesases, modulate the proliferation, differentiation, as ischamic heart disease, modulate the proliferation, differentiation, as ischamic heart diseases, modulate the proliferation of bone and cartilage cells and to treat bone and/or cartilage associated diseases or disorder, and cerebral ocdema, hydrocephalus, brain herniations, latrogenic disease, inflammations, concernial and viral meningits, Alzheimer's Disease, cerebral cancers, parkinson's disease, multiple sclerosis, brain cancers, hydrocephalus and encephalitis, and treat hepatic disorders.

Concert the present sequence does not appear in the specification; it was concert and meninging concerns and care descended ones not appear in the present sequence does not appear in the specification; it was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5

TISSUE SPECIFICITY: Highly expressed in tumor endothelial cells but not in normal endothelial cells.

DOMAIN: Blading to PA seems to be effected through the VWA domain. SIMILARITY: BELONGS TO THE ATR FAMILY.

SIMILARITY: CONTAINS 1 VWFA DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  88888888888888

SUBCELULAR LOCATION: Type I membrane protein (Probable).
ALTERNATIVE PRODUCTS: 2 isocorms; 1 (shown here) and 2; seem to be produced by alternative splicing.
DOMAIN: Binding to PA seems to be effected through the VWA domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Transmembrane; Glycoprotein; Signal; Alternative splicing

-1. SUBCELLULAR LOCATION: Type I membrane protein.
-1. SUBCELLULAR LOCATION: Type I membrane protein.
-1. SUBCELLULAR LOCATION: Type I membrane protein.
-1. TISSUE SPECIFICITY: EXPRESSED MODERATELY ON MYELOMONOCYTIC CELL
LINES AND SUBSETS OF PERIPHERAL BLOOD LEUKOCYTES AND STRONGIY ON TISSUE-SPECIALIZED CELLS, INCLUDING MACROPHAGES FOAM CELLS WITHIN ATHEROSCLEROTIC PLAQUES, AND ON SPLENIC RED PULP MACROPHAGES.
-1. DOMAIN: THE INTEGRIN I LOMAIN (INSERT) IS A VWFA DOMAIN. INTEGRINS WITH I-DOMAINS TO THE INTEGRIN ALPHA CHAIN FAMILY.
-1. SIMILARITY: CONTAINS 1 VWFA DOMAIN.
-1. SIMILARITY: CONTAINS 7 FG-GAP REPEATS.
"The leukocyte integrin alpha D beta 2 binds VCAM-1: evidence for a binding interface between I domain and VCAM-1.";
J. Immunol. 163:1984-1990(1999).
-!- FUNCTION: INTEGRIN ALPHA-D/PETA-2 IS A RECEPTOR FOR ICAM3 AND VCAM1. MAY PLAY A ROLE IN THE ATHEROSCLEROTIC PROCESS SUCH AS CLEARING LIPOPROTEINS FROM PLAQUES AND IN PHAGOCYTOSIS OF BLOODBORNE PATHOGENS, PARTICULATE MATTER, AND SENESCENT ERYTHROCYTES FROM THE BLOOD.

C. I- FUNCTION: INTEGRIN ALPHA-N/BETA-2 IS IMPLICATED IN VARIOUS

AS WELL AS IN MEDIATING THE UPTAKE OF COMPLEMENT-COAFED PARTICLES.

IT IS IDENTICAL WITH GR-3. THE RECEPTOR FOR THE IC13B FRAGMENT OF

THE THIRD COMPLEMENT COMPONENT. IT PROBABLY RECOGNIZES THE R-G-D

PEPTIDE IN CASE INTEGRIN ALPHA-N/BETA-2 IS ALSO A RECEPTOR FOR

FIBRINOGEN, FACTOR X AND ICAMI. IT RECOGNIZES PI AND P2 PEPTIDES

OF FIBRINOGEN, FACTOR X AND ICAMI. IT RECOGNIZES PI AND P2 PEPTIDES

OF FIBRINOGEN, FACTOR X AND ICAMI. IT RECOGNIZES PI AND P2 PEPTIDES

OF SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA SUBUNIT. ALPHA-M

ASSOCIATES WITH BETA-2.

ILSUBLULAR LOCATION: Type I membrane protein.

"The complete primary structure of type XII collagen shows a chimeric molecule with reiterated fibronectin type III motifis, von Willebrand factor A motifs, a domain homologous to a noncollagenous region of type ix collagen, and short collagenous domains with an Arg-Gly-Asp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TISSUE SPECIFICITY: TYPE XII COLLAGEN IS PRESENT IN TENDONS, .
LIGAMENTS, PERICHONDRIUM, AND PERIOSTEUM, ALL DENSE CONNECTIVE
TISSUES CONTAINING TYPE I COLLAGEN.
DOMAIN: THIS SEQUENCE DEFINES FIVE DISTINCT DOMAINS, TWO TRIPLE-
DELICAL DOMAINS (COLL AND COL2) AND THREE NONTRIPLE-HELICAL
DOMAINS (NC1, NC2, AND NC3).
PTW: THE TRIPLE-HELICAL TAIL IS STABILIZED BY DISULFIDE BONDS AT
EACH END.

-i- FUNCTION: INTEGRIN ALPHA-M/BETA-2 IS IMPLICATED IN VARIOUS
ADHESTYE INTERACTIONS OF MONOCYTES, MACROPHAGES AND GRANULOCYTES
AS WELL AS IN MEDIATING THE UPTAKE OF COMPLEMENT-COAPED PARTICLES.
IT IS IDENTICAL WITH CR-3, THE RECEPTOR FOR THE IC3B FRAGMENT OF
THE THIRD COMPLEMENT COMPONENT. IT PROBABLY RECOGNIZES THE R-G-D
PETTIDE IN C3B. INTEGRIN ALPHA-M/BETA-2 IS ALSO A RECEPTOR FOR
FIBRINOGEN, FACTOR X AND ICAMI. IT RECOGNIZES PI AND P2 PEPTIDES
OF FIBRINOGEN GAMMA CHAIN. ALPHA-M/BETA-2 PLAY A CRITICAL ROLE IN
MAST CELL DEVELOPMENT AND IN IMMUNE COMPLEX-MEDIATED
GLOMERULONEPHRITIS. MICE EXPRESSING A NULL MUTATION OF THE ALPHA-M
SUBUNIT GENE DEMONSTRATE INCREASE IN NEUTROPHIL ACCUMULATION, IN
RESPONSE TO A IMPAIRED DEGRANULATION AND PHAGOCYTOSIS, EVENTS THAT

INTEGRINS WITH I-DOMAINS DO NOT UNDERGO PROTEASE CLEAVAGE.
-i- SIMILARITY: BELONGS TO THE INTEGRIN ALPHA CHAIN FAMILY.
-i- SIMILARITY: CONTAINS I VWFA DOMAIN.
-i- SIMILARITY: CONTAINS 7 FG-GAP REPEATS.
                                                                                                                                                                             ASSOCIATES WITH BETA-2.
-1- SUBCELLULAR LOCATION: Type I membrane protein.

SIMILARITY: BELONGS TO THE FIBRIL-ASSOCIATED COLLAGENS WITH
INTERRUPTED HELICES (FACIT) FAMILY.
SIMILARITY: CONTAINS 4 VWFA DOMAINS.
SIMILARITY: CONTAINS 18 FIBRONECTIN TYPE III-LIKE DOMAINS.
ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING. THE FINAL TISSUE FORM OF COLLAGEN XII MAY CONTAIN HOMOTRIMERS OF EITHER THE LONGER OR THE SHORTER ISOFORM OR ANY COMBINATION OF LONG AND SHORT ISOFORM CHAINS. ONLY THE LONG VARIANT IS A PROTEOGLYCAN. TISSUE SPECIFICITY: HIGHEST EXPRESSION IN TRENDONS, PERICHONDRIUM, SICHERA, BLOOD VESSELS, AND PERIOSTEUM.

DEVELOPMENTAL STAGE: LONG FORM OF COLLAGEN XII, XIIA, IS THE PREDOMINANT FORM AF EARLY STAGES (ED? AND 11); AT LATER STAGES OF DEVELOPMENT (ED15 AND 17) THE SHORT FORM BECOMES THE MAJOR PRODUCT, THE LONG SPLICE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PIRINE; FROOD14; VENTYPEIII.

"Murine complement C2 and factor B genomic and cDNA cloning reveals
different mechanisms for multiple transcripts of C2 and B.";
J. Biol. Chem. 265:19040-19046[1990].
-I- FUNCTION: COMPONENT C2 WHICH IS PART OF THE CLASSICAL PATHWAY OF
THE COMPLEMENT SYSTEM IS CLEAVED BY ACTIVATED FACTOR C1 INTO TWO
FRAGMENTS: C2B AND C2A. C2A, A SERINE PROTEASE, THEN COMBINES WITH
COMPLEMENT FACTOR 48 TO GENERATE THE C3 OR C5 CONVERTASE.
-I- CATALYTIC ACTIVITY: CLEAVES C3 IN THE ALPHA-CHAIN TO YIELD C3A AND
C18AVAGES TAKE PLACE AT THE C-TERMINAL OF AN ARGININE RESIDUE.
-I- MISCELLANEOUS: C2 IS A MAJOR HISTOCOMPATIBILITY COMPLEX CLASS-III
                                                                                                                                                                                                                                        PROTEIN.
-!- SIMILARITY: WITH COMPLEMENT FACTOR B.
-!- SIMILARITY: CONTAINS 3 SUSHI (SCR) DOMAINS.
-!- SIMILARITY: CONTAINS 1 VWFA DOMAIN.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE TRYPSIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEROPS; S01.194; -.

-!-FUNCTION: AN ADHESTVE ROLE BY INTEGRATING COLLAGEN BUNDLES. IT IS PROBABLY ASSOCIATED WITH THE SURFACE OF INTERSTITIAL COLLAGEN WHICH FIRST FROM THE FIREL MAD PROPREDES AS A RIGID ARM WHICH STICKS OUT FROM THE FIBRIL AND PROPREDES THE LARGE N-TERMINAL GLOBULAR DOWNIN INTO THE EXTRACELLULAR SPACE, WHERE IT MIGHT INTERACT WITH OTHER MATRIX MOLECULES OR CELL SURFACE
                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
